

ABSTRACT

Various devices and methods are disclosed for preventing the spread of contaminants that may be present on devices such as, for example, shopping carts, high chairs, and booster seats. In one embodiment, a box-shaped seat liner with leg openings is placed in a seating area of a device to protect the occupant of the seat liner from contaminants and/or to provide cushioning for the occupant. In another embodiment, a contaminant shield can be placed over the handle of a device to protect against exposure to contaminants and/or to provide cushioning around the handle.
